

ATP applies its own life expectancy model

The model uses data from 18 comparable countries

Forecast of life expectancy in Denmark

ATP's calculation of the size of the amounts to be paid to current and future pensioners is based on a life expectancy model. The model is based on a range of assumptions about future developments in life expectancy.

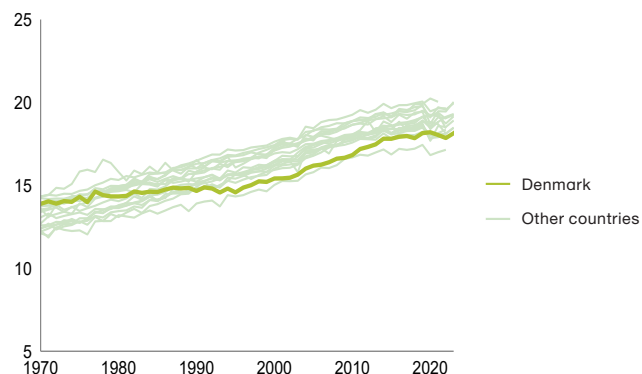

Uniform pattern in life expectancy development

Over the past 100 years, life expectancy in the western world has increased steadily. There are, however, differences between countries in when and how quickly this increase is seen. This applies to Denmark, too. The historical life expectancy improvement variation makes it difficult to predict how life expectancy will develop in the future.

The ATP life expectancy model is based on the fact that there is a uniform pattern of life expectancy development across the industrialised world. There is good cause to believe that this development will continue in the future, since western nations share commonalities, in respect, for example, of lifestyles, treatment opportunities and socio-economic factors.

For this reason, ATP's life expectancy model does not only rely on Danish data, but also includes data from a number of other OECD countries which, in the view of ATP, are comparable to Denmark. The purpose of this is to provide a stable prognosis for future life expectancy improvements. The ATP life expectancy model is based on the assumption that Danish life expectancy trends follow the international trend, getting closer to the international average in the longer term. This makes it important that the countries

Forecast of life expectancy internationally

included in the international data set are comparable to Denmark. ATP's life expectancy model uses life expectancy data from 1970 and onwards from 18 industrialised OECD countries with a total of approximately 350 million citizens.

Comparison with the Danish Financial Supervisory Authority's life expectancy model

In 2011, the Danish Financial Supervisory Authority introduced a life expectancy benchmark with the purpose of ensuring that pension companies held sufficient funds to secure the pension for current and future pensioners.

The Danish Financial Supervisory Authority's life expectancy model differs from ATP's. The Financial Supervisory Authority's model applies Danish data from the last 20 to predict future life expectancy improvements. If ATP's pension liabilities were calculated using the Danish Financial Supervisory Authority's life expectancy model, they would be DKK 19.7bn lower than when calculated using ATP's life expectancy model.

| Age in 2025 | Life expectancy (years) | |
|-------------|-------------------------|-------|
| | Men | Women |
| 0 | 93 | 95 |
| 20 | 90 | 93 |
| 40 | 88 | 91 |
| 60 | 86 | 89 |
| 80 | 89 | 90 |
| 100 | 102 | 102 |
